can I do that? A.tag__c = T; A: Found it, I did this: A.tag__c = null; A.update();

Thanks KANSAS CITY, Mo. -- Police say a priest who started a fire while cooking in his rectory kitchen in downtown Kansas City, Mo., on Jan. 31 wasn't aware that a building ordinance required him to notify the fire department before starting a fire. He was ticketed for failure to comply, but the ticket wasn't given to him, and he never paid the \$85 fine. He said he knows if he doesn't pay the fine, the case will be dropped. "I have money problems and I won't have money to pay for this," Father William Weimann told KCUR, "So I need a way to pay." Father Weimann says he lit a fire to make coffee in the kitchen of his rectory at about 11:15 a.m. He says he was cooking because he had been awake since 6 a.m. and hadn't eaten. He says he won't be giving up his habit of making coffee in his kitchen. "I can do it without bothering anybody," he said. "If it's in the

rectory, it's not bothering anybody." He says it was the fire that woke the parish's temporary administrator, who called 911. "I guess I was making a racket," he said. The fire displaced the parish treasurer, administrator and the financial advisor.

Free Download Full Version.Q: Organising
fixtures in Rails 2.x/3.x I would like to
know how best to structure fixtures in
Rails, i.e., the exact file locations. I know
that in Rails 2.x you can put fixtures in
src/fixtures/test_users.yml and include
them with fixtures :test_users, but this
doesn't play nicely with sass and
sprockets. It's much easier to name the
files something like
fixtures_test_users.yml and include them
like this: fixtures :fixtures_test_users, and
have a corresponding _test.yml file.

However, when you do this, I can't
reference the test user's email in my test.
Is there a way to do this without having to
name the files explicitly, and having to
maintain the two kinds of files manually?

A: Create a sub-folder at the root of the
"test" folder for the fixtures, so for
example: # fixtures/test | |-users |
- app_users.yml | - toxic_users.yml

|-companies This is how I do it and it works great for me. A: You can also use Rails 3 migration with fixtures with Proc, it's like this: country = Country.create(:name => 'United States') generate_fixture('country', :country, 'users.yml', {:id => country.id}) rake db:test:prepare Show HN: HN - reddit in the browser, data-coupled - eitland ===== eitland As per the title, we are open to any feedback you may have. We started hacking this about a year and a half ago
